**SIRVE A COLOMBIA EN EL MUNDO ENTERO**

te la vida del papel en referencia se llama *Cotización de Compra o de Adquisición*. Estas cotizaciones se expresan en porcentajes sobre el valor nominal del título (o, lo que resulta ser lo mismo, se expresa el valor de la cotización del título en porcentajes de su valor nominal). El valor nominal del papel de valor o del préstamo corresponde entonces a una cotización del 100%. Los intereses se pagan siempre sobre el valor nominal también si la cotización emisor o de compra no corresponde al 100%. Si la cotización de compra es inferior al 100%, el interés efectivo es superior, y si la cotización de compra es superior al 100%, el interés efectivo es inferior al interés nominal. Ahora bien, el interés efectivo no es sólo el interés nominal con respecto a la cotización de compra. Cuando la cotización de compra es inferior al valor nominal, produce eso al vencimiento del título una ganancia igual a la diferencia entre el valor nominal y la cotización de compra. Así mismo se produce una pérdida si la cotización de compra es superior al valor nominal. Esta ganancia o pérdida debe tenerse en cuenta para el cálculo del interés efectivo para disponer de la comparabilidad con otras inversiones de capital, que como por ejemplo en el caso de depósitos bancarios, no producen ganancias o pérdidas de esta forma. Lógicamente una ganancia en la cotización cuando se efectúa el reembolso, aumenta el interés efectivo, una pérdida lo disminuye. Al tener en cuenta la ganancia o pérdida producida en el momento del vencimiento, se destaca pues aún más el hecho de que con una cotización de compra inferior al 100% aumenta el interés efectivo, y que en cambio el interés efectivo disminuye si la cotización de compra es superior al 100%.

2. Con el fin de aumentar su atractivo, se reembolsan muchos títulos no con el valor nominal es decir, no al 100%, sino a la llamada cotización de vencimiento que incluye un valor adicional. (Bonificación final). Así mismo existe la posibilidad de que se produzca en la Bolsa una cotización de venta en caso de que el propietario quiera realizar la inversión en una fecha anterior al ven-

## FORMULAS

Las tablas de esta obra se han calculado según las Fórmulas, que indicamos a continuación.

Tablas página 1 hasta 144

$$C = \frac{100 i \cdot a \cdot \dots + 100 v'^n}{\bar{n} | i'}$$

Tablas página 145 hasta 300.

$$C = \left[ 100 \left[ 1 - i' \cdot \left\{ \frac{i i'}{(12 \sqrt[12]{1 + i' - 1})} \right\}^{a' | \bar{n}} \right] \right]$$

Tablas Anexo I:  $A = v'^n$

Tablas Anexo II:  $\bar{n} = \frac{\log n \cdot \log a' | \bar{n}}{\log (1 + i')}$

Tablas Anexo III:  $i' = (1 + i'(m))^{12/m} - 1$

Los símbolos en las fórmulas tienen el siguiente significado, que a continuación se indican:

- $i$  = Tipo nominal de interés
- $i'$  = Tipo Efectivo de interés
- $100 i'$  = Rentabilidad Efectiva

$$\frac{a'}{\bar{n}} = \frac{1 - v'^n}{i'}$$

- $n$  = Vida del título en años o unidades de tiempo
- $\bar{n}$  = Vida promedio del título
- $C$  = Cotización de compra
- $A$  = Aumento por cada 10/0 de diferencia en la cotización
- $i'(m)$  = Rentabilidad obtenida en m meses.

efectivo para la emisión con una cotización de emisión del 95<sup>o</sup>/<sub>o</sub>?

Los gastos y costos son 11/2<sup>o</sup>/<sub>o</sub> del valor de la emisión, este porcentaje se debe descontar de la cotización de emisión. Con el descuento inicial así disminuído (93.5<sup>o</sup>/<sub>o</sub>) se halla en la página 215 el valor de rentabilidad 14<sup>o</sup>/<sub>o</sub>.

### Ejemplo 10.

Características de este problema: Reembolso o sea venta del título se efectúa a una cotización distinta del 100<sup>o</sup>/<sub>o</sub>.

Se busca: La rentabilidad efectiva anual.

Método general de aplicar: Para calcular en este caso la rentabilidad efectiva, se debe en primer lugar transformar la cotización en la fecha de la compra, o sea de emisión con la ayuda de la tabla Anexo I. En el siguiente ejemplo indicamos las reglas sobre como se debe efectuar esta operación. Con la cotización transformada calculamos entonces como en los ejemplos anteriores.

### Problema:

Una compañía de seguros compra bonos ganaderos al 8<sup>o</sup>/<sub>o</sub> anual (pagado por trimestres vencidos) a la cotización de 75<sup>o</sup>/<sub>o</sub> y vende los mismos 3 años más tarde al 82<sup>o</sup>/<sub>o</sub>. Cuál es la correspondiente rentabilidad efectiva anual?

Para la iniciación de los cálculos correspondientes se necesita una primera estimación de la rentabilidad. Se obtiene rápidamente una aproximación suficientemente exacta de la siguiente manera: Se determina la rentabilidad corriente (Columna "Indefinida") correspondiente a la cotización de emisión o sea de compra. A este valor se tiene que sumar el cociente formado por la diferencia entre la cotización inicial y final en el numerador y la duración correspondiente en el denominador. (Si la cotización de compra es más alta que la cotización de venta, entonces, claro está, se debe restar esta diferencia). Al aplicar las anteriores consideraciones a nues-

tro ejemplo, obtenemos el siguiente resultado: Si el interés de la emisión es del 8%, el período de 3 años, la cotización inicial del 75% y la cotización de reembolso del 82%, obtenemos de la tabla al 8% en la página 182 columna de duración "Indefinida", a una cotización del 75%, el 11.2% como rentabilidad corriente. Se aumenta ahora este valor en un 1/3 de la diferencia entre 75% u 82%. Resultado:  $11.2 + 2.33 = 13.5\%$ . Este porcentaje es la primera estimación de la rentabilidad buscada. Se forma ahora la diferencia entre la cotización del reembolso del 82% y el valor nominal de los títulos del 100%. Resultado 18%. La tabla de Anexo I indica en la columna de 3 años para un interés efectivo del 13.5% el valor de 0.684 (definido por medio de interpolación). Este valor se refiere a una diferencia del 1% entre la cotización de reembolso y el valor nominal de 100. Puesto que esta diferencia es aquí del 18%, se debe multiplicar este valor por 18. Resultado: 12.31. Puesto que el valor de reembolso es inferior al valor nominal se debe sumar este último valor al valor de compra de 75%.

Resultado:  $75 + 12.3 = 87.3$

Con esta cotización de venta, así transformado, se procede entonces de la misma manera indicada para la solución de los ejemplos anteriormente indicados. Es decir, buscamos en la tabla 8% en la columna 3 años, y hallamos para la cotización 87.3% el interés efectivo del 13.9%.

niendo en cuenta que la fecha del reembolso es desconocida. Si el comprador se queda con el título hasta el reembolso planeado, representa la rentabilidad promedio, la rentabilidad más probable entre todas las rentabilidades posibles, suponiendo el desconocimiento de la fecha cual resulta favorecida al título de sorteo, el cual se aproxima tanto más al interés efectivo realmente obtenido, cuanto mayor cantidad de títulos tenga en su poder. En este ejemplo se puede utilizar la tabla Anexo II para determinar el promedio del tiempo futuro. Para un tiempo de amortización de 6 años sacamos de la Tabla correspondiente los valores 3, 1, hasta 3, 5 como función del interés efectivo. Para determinar exactamente el promedio de tiempo necesitamos pues una primera aproximación del interés efectivo que obtenemos en la misma forma como lo hemos indicado en el ejemplo No. 10.

El resultado es 11.7% (página 200) más 10: 6.5 = 1.538  $\Rightarrow$  13.2%.

Para este valor de interés efectivo, el promedio de tiempo (para una amortización en 6 años) es pues 3.3 años. Pero a esto hay que agregar el tiempo sin amortización, es decir el tiempo del 1o. de Mayo de 1968 hasta el comienzo de la amortización en fecha Septiembre 1o. de 1971 con 3 $\frac{1}{2}$  años. Resultado: 6.8 años. Con este tiempo en la página 199 encontramos con un descuento del 90%, una rentabilidad del 13.1% para la duración de 6 años. La interpolación nos indica que la rentabilidad efectiva para 6.8 años es de un 12.9%.

#### Ejemplo 9.

Características de este problema: Inclusión de gastos.  
Se busca: La rentabilidad efectiva.

#### Problema:

Una corporación emite bonos por valor de 10 millones al 12% pagados por meses vencidos, que se reembolsarán al cabo de 10 años al 100%. Esto lo produce gastos y costos de \$150,000. Cuánto es el recargo anual

De la tabla Anexo III obtenemos que la rentabilidad efectiva anual correspondiente a 2.7% mensual es 37.7% (interpolación entre 34.5 y 42.6)

#### **Ejemplo 7.**

Características de este problema: Se conocen el descuento inicial, el interés nominal y la probabilidad de sorteos. Se busca: Rentabilidad mínima y máxima efectiva anual.

#### **Problema:**

Alguien obtiene el 1o. de Julio de 1968 un título al 14% pagadero por meses vencidos al 95%, vencimiento a más tardar el 1o. de Julio de 1980 al valor nominal. La amortización de los títulos se hace gradualmente con sorteos trimestrales.

Cuál es la rentabilidad mínima efectiva y la rentabilidad máxima efectiva?

Para obtener la rentabilidad mínima efectiva se debe tener en cuenta que el título será pagado a más tardar al cabo de 12 años. En la página 232 hallamos la respuesta 16.0%.

A la rentabilidad efectiva máxima corresponde una duración de 4 años, suponiendo que la fecha más temprana para el sorteo sea el 1o. de Julio de 1972. La correspondiente contestación (16.8%) se halla en la página 231.

#### **Ejemplo 8.**

Características de este problema: Se conoce el descuento inicial, el interés nominal y la probabilidad de sorteos. Se busca: La rentabilidad efectiva promedio anual.

#### **Problema:**

Alguien compró el 1o. de Marzo de 1968 un título de una emisión del 10% (pagada por meses vencidos) a la cotización del 90%. La deuda se amortizará en sorteos anuales a partir del 1o. de Septiembre de 1972 hasta el 1o. de Septiembre de 1977 en seis cuotas iguales. Se debe ahora calcular la rentabilidad promedio efectivo, te-

no es el año, sino el mes. (Rentabilidad de los certificados tributarios).

Se busca: La rentabilidad efectiva.

### Problema:

El precio del CAT el 31 de Diciembre de 1972 con vencimiento en Agosto de 1973 era 87.59%. Cuál es el rendimiento mensual y anual?

La solución se encuentra por lo tanto en la tabla de interés nominal cero.

Para la redención faltan 8 meses. Considerando como unidad de tiempo el mes, leemos en la página 3 columna 8 una rentabilidad de 1.7% correspondiente a una cotización de 87.5% y una rentabilidad de 1.6% correspondiente a una cotización de 88.0%. Con una interpolación obtenemos para la cotización de 87.59% una rentabilidad de 1.7% siempre y cuando se calcule con una sola cifra después de la coma.

La rentabilidad efectiva anual la obtenemos de la tabla Anexo III en la página 305, columna "1 mes". La interpolación entre la rentabilidad de 1.6% y 1.8% mensual (con rentabilidades de 21.0 y 23.9% respectivamente) nos indica una rentabilidad anual de 22.4%.

### Ejemplo 6.

Características de este problema: El inversionista tiene el título durante un tiempo inferior a 1 año.

Se busca: rentabilidad efectiva anual.

### Problema:

Un inversionista compra un título a la cotización del 91% y lo vende después de 5 meses a la cotización de 100. Cuál fue su rentabilidad, si se ha pagado un interés nominal del 8 1/2% anual pagado por meses vencidos?

Solución: El interés mensual proporcional se encuentra en la página 51.

En la columna "4" leemos la contestación: 2.7% efectivo mensual.

Según las consideraciones efectuadas en la introducción, las tablas no sirven solamente para pagos mensuales, sino también para pagos trimestrales.

Solución: En la página 207 leemos la solución 12,5%.

### **Ejemplo 3.**

Características de este problema: Se conoce la rentabilidad y el interés nominal. Al vencimiento se paga el valor nominal.

Se busca: La cotización inicial.

#### **Problema:**

Cuál es el máximo descuento que se puede estipular en una emisión, si con una vida de cinco años de la inversión y con un interés nominal del 8%, se quiere reconocer al suscriptor una rentabilidad efectiva del 12%.

Solución: En la página 183 hallamos la solución en la columna "5" con la línea de la rentabilidad 12%, la cotización de un 87.0%.

### **Ejemplo 4.**

Características de este problema: El interés nominal del título es bajo y se paga por años.

Se busca: La rentabilidad efectiva anual.

#### **Problema:**

El señor X tiene durante 5 años un título sobre el cual se efectúa un interés del 3% pagado por años vencidos. Cuál es la rentabilidad de este título, si él fué comprado a una cotización de 45% y vendido a la cotización de 100%.

Solución: Se trata de un problema que se tiene que resolver con las tablas amarillas porque el interés se paga anualmente. En la página 141 leemos en la columna 5 (períodos que faltan para la redención) correspondiente a la cotización 45 la rentabilidad 22.3%.

### **Ejemplo 5:**

Características de este problema: La unidad del tiempo

# PROTECCION

**SURAMERICANA**

SEGUROS • FONDO • CAPITALIZACION

del título se efectúan a su valor nominal. Los intereses se cancelan mensualmente.

Se busca: La rentabilidad anual efectiva.

### Problema:

Una persona obtiene un título de una emisión del 10% pagadero mensualmente a una cotización del 100%, y vende el mismo después de tenerlo durante 2 años al mismo precio. Cuál es la rentabilidad anual efectiva de este título? La solución la encontramos en la página 199. Leemos la contestación 10.5% al lado de la cotización "100".

Nota: Si los intereses se hubieran pagado en forma trimestral el resultado no hubiera diferido en la primera posición del coma.

### Redondamiento:

Se observa que la rentabilidad en este caso es independiente de la duración de la vida del título. En algunos casos patológicos en los cuales los redondamientos de computador pueden afectar la cifra decimal a causa de las interpolaciones, (por ejemplo página 176 con 7%) es más prudente calcular con la rentabilidad indicada en la última columna "indefinido", porque este valor se ha obtenido directamente.

### Ejemplo 2.

Características de este problema: La compra del título se efectúa a una cotización diferente del 100% del valor nominal. La venta del título se efectúa a la cotización del 100%.

Se busca: Rentabilidad efectiva anual.

### Problema:

Alguien tenía un bono de desarrollo económico "B" de 1960 hasta 1970, al 11% anualmente pagadero por trimestres vencidos.

Cuál fué su rentabilidad, si fué adquirido a la cotización de 95%?

existen dos aplicaciones de esta tabla:

1. Determinación de la rentabilidad siempre y cuando el interés nominal es bajo, (entre 0 o/o y 3o/o anual) y se paga por lo tanto anualmente.
2. Si el tiempo que falta para la redención es corto, por ejemplo solamente unas semanas o meses. El interés técnico indicado en las tablas se puede considerar ahora como un interés proporcional y los períodos que faltan para la redención no significan más años, sino cualquier otra unidad de tiempo (meses, trimestres, etc.) En los ejemplos siguientes vamos a indicar sobre estas aplicaciones.

En las páginas 145 hasta 300 hemos calculado con un tipo nominal de interés, es decir, con un interés que se efectúa 12 veces por unidad de tiempo. Estas tablas se utilizan para la determinación de la rentabilidad siempre y cuando el interés se pague mensualmente y si hay más de un año que falte para la redención.

En las páginas 301 hasta 306 se han imprimido los Anexos I, II y III.

La Tabla del Anexo I nos sirve como Tabla de "Ajuste" para calcular la rentabilidad de una inversión nominal, siempre y cuando la cotización del título en la fecha de la venta sea diferente al valor nominal.

La Tabla del Anexo II sirve para incluir la posibilidad del sorteo en los cálculos de la rentabilidad. Siempre y cuando el tiempo que falte para la redención sea incierto a causa de sorteos tenemos que determinar antes la llamada "Duración Media" con la Tabla del Anexo II.

Las Tablas del Anexo III finalmente sirven, para expresar una rentabilidad, que se ha obtenido en partes inferiores a un año, a una rentabilidad anual.

### Ejemplo 1.

Características de este problema: La compra y venta

La influencia de la duración de la vida del título se puede indicar por lo tanto en la forma siguiente:

Si la cotización de la venta o del reembolso está por encima de la cotización de adquisición o de compra, el rendimiento es mayor, si la duración de la vida del título es corta.

Si la cotización de la venta o del reembolso está por debajo de la cotización de adquisición o de compra, el rendimiento es tanto menor cuanto más corta sea la duración de la vida del título.

La utilidad obtenida por el acreedor en su inversión representa la carga para el deudor, que éste debe sufragar del rendimiento del préstamo. Si no tenemos en cuenta los gastos producidos por la adquisición y administración del título, representa el mismo interés efectivo que expresa la rentabilidad para el acreedor, también el cargo efectivo para el deudor.

Es fácil tener en cuenta gastos adicionales (por ejemplo gastos de emisión), refiriéndolos sobre 100 Unidades monetarias y deduciéndolos de la cotización de emisión. La rentabilidad calculada con una cotización disminuída en esta forma, representa entonces el cargo anual efectivo del deudor del préstamo o del título con inclusión de costos. El interés efectivo obtenido en esta forma naturalmente ya no coincide con la rentabilidad del acreedor.

Aparte de los pagos mensuales de los intereses hemos, en la "Tabla de rentabilidad efectiva", calculado también los pagos trimestrales. Pero si se calcula la rentabilidad con una sola cifra después de la coma, no hay prácticamente ninguna diferencia entre pagos mensuales y pagos trimestrales de los intereses. En consecuencia hemos desistido de imprimir la rentabilidad con pagos trimestrales.

Las primeras 144 páginas se han calculado con un tipo efectivo de interés, es decir, con un interés que se efectúa una sola vez por unidad de tiempo. Principalmente

interés nominal, sí:

- a— el reembolso o sea la venta se efectúa también al precio de 100%.
- b— se pagan los intereses una vez al año.

Naturalmente eso ocurre exactamente una vez que coincidan los intereses nominales con los intereses efectivos a pesar de que (a) y (b) no se cumplan. Pero la cotización de adquisición correspondiente no es el 100%; de ninguna manera se puede fijar esta cotización de antemano. Esta cotización debe ser calculada en cada caso individualmente. Cuando coinciden el interés efectivo y el interés nominal, se llama la cotización de adquisición cotización *Matemática a la par*, contrario a la cotización *Bursátil a la par*, la cual es siempre 100%.

Utilizando estas denominaciones, se puede resumir la regla anterior como sigue:

La cotización matemática a la par sólo es igual a la cotización bursátil a la par cuando el título paga intereses una vez al año, y es adquirido y reembolsado al 100%.

Al calcular el interés efectivo, se debe tener en cuenta las tres conclusiones antes mencionadas, es decir, hay que considerar:

- a— El valor y la forma de pago del interés nominal (Suponemos en la tabla de referencia pagos mensuales).
- b— Cotización de compra o suscripción
- c— Cotización de venta o de reembolso.

A lo anterior hay que agregar aún:

- d— El tiempo que transcurre entre las fechas de adquisición y de reembolso o sea de compra y de venta, porque es obvio que la ganancia obtenida o la pérdida sufrida en el momento de la venta o del reembolso tiene tanto mayor repercusión cuanto más corto haya sido este período.

cimiento prevista en el título. Esta cotización puede ser mayor o menor que el valor nominal con respecto a 100. En este caso hay que tener en cuenta no la diferencia entre valor nominal y cotización de compra, sino la diferencia entre el valor de reembolso y el valor de compra para el cálculo de la ganancia o la pérdida respectivamente. En consecuencia sufre la primera regla indicada bajo el punto 1, (interés nominal = interés efectivo si la cotización de compra es 100) una excepción. Esta regla sólo vale cuando el reembolso también se efectúa al 100%. De otra manera también con una cotización de compra del 100% el interés efectivo difiere del interés nominal.

3. En Colombia se ha venido acostumbrando el pago de los intereses sobre títulos no por años sino por períodos inferiores. Con mayor frecuencia se efectúa el pago mensual o trimestral. Este pago de los intereses ofrece -y este ha sido el motivo de su implantación- al inversionista una ventaja comparado con el pago anual del interés, porque el valor de los intereses trimestrales o mensuales está disponible antes del término de un año, por ejemplo para una reinversión. Esta ventaja debe producir *ceteris paribus* un aumento del interés efectivo en comparación con los intereses pagaderos anualmente. Puesto que la rentabilidad efectiva se refiere siempre al año (para permitir la comparación con otras clases de títulos), basta el hecho de los pagos del interés en subperíodos para impedir la concordancia entre los intereses nominales y los intereses efectivos, aún sin los motivos indicados bajo los párrafos 1 y 2. Esta es la razón porque por ejemplo la rentabilidad efectiva de un título con pago mensual de intereses, con una cotización de adquisición de 100% y una cotización de vencimiento también de 100% está sin embargo superior al interés nominal del préstamo o título en referencia.

En resumen se puede decir lo siguiente:

El interés efectivo sólo coincide (en caso de un precio de adquisición o de compra a la tasa del 100%) con el

# TABLA DE RENTABILIDAD

## INTRODUCCION

El cálculo de la rentabilidad de una inversión de capital constituye una de las tareas más importantes en los sistemas bancarios, de bolsa y de créditos. Generalmente se conoce el llamado interés nominal o sea, el interés inscrito en los papeles de valores, fijado comunmente por los emisores. Pero lo que interesa especialmente al inversionista no es este interés nominal sino el interés efectivo o sea la llamada *rentabilidad* de la inversión en referencia. Sólo en casos especiales coinciden en la práctica la rentabilidad y el interés nominal. Puesto que el cálculo de la rentabilidad efectiva constituye una tarea difícil, muchas veces imposible para las personas profanas en la materia hemos, elaborado en colaboración con la Bolsa de Bogotá, la Asociación de los Actuarios Colombianos, de Asecolda, la Asociación Bancaria, la Superintendencia Bancaria y la Superintendencia de Sociedades, la siguiente tabla de rentabilidad efectiva. Queremos aprovechar la ocasión para expresar a estas entidades nuestros agradecimientos por la colaboración prestada.

Cuáles son entonces las razones porque el interés nominal no coincida con el interés efectivo?

Hay tres motivos que, individualmente o en común, producen la disconformidad entre el interés nominal o sea el interés pagado y el interés efectivo o sea la rentabilidad del capital invertido, y que exigen un cálculo especial del último.

1. No siempre se ofrecen a la práctica, títulos al llamado valor nominal o sea el precio indicado en los correspondientes papeles. Con frecuencia el precio es inferior o superior al valor nominal, llamado —en caso de adquisición del título en la emisión— *Cotización de Emisión*, *Cotización de Asignación* o *Cotización Emisor*, en caso de adquisición después de la emisión duran-

Gracias a las instrucciones claras y precisas contenidas en la primera parte de ellas, estas "Tablas de Rentabilidad Efectiva" poseen una aplicación universal en Bancos, Compañías de Seguros, Fondos de Inversión, Sociedades Financieras, Capitalizadoras, Corporaciones Financieras, etc., y pueden ser empleadas tanto para valores de renta fija (Bonos, Cédulas Hipotecarias, Cat's, Pagarés, etc.), como para aquellos de renta variable (Acciones, Bonos Convertibles, etc.).

Queremos dejar constancia de nuestro agradecimiento a la Asociación Colombiana de Compañías de Seguros "ASECOLDA", por su aporte financiero para la realización de este proyecto, a la Asociación Bancaria de Colombia por su patrocinio y a todas las instituciones que nos han apoyado con anuncios en estas páginas. Así mismo, expresamos nuestros agradecimientos a "Colsistemas", en cuyos computadores se efectuaron los cálculos y last but not least a las Compañías de Seguros afiliadas a nuestra Asociación por su permanente contribución y colaboración para poder cumplir los objetivos que nos hemos trazado en todo lo relacionado con la ciencia actuarial.

CAMILO PIESCHACON V.  
Presidente

Bogotá, Enero de 1974

Es muy grato para la Asociación Colombiana de Actuarios presentar a los diferentes círculos financieros y económicos del país estas "Tablas de Rentabilidad Efectiva", las cuales han sido elaboradas tomando en cuenta las necesidades peculiares de Colombia.

En efecto, en la mayoría de los países industriales existen las llamadas "Bond Tables", mediante las cuales es posible determinar en cualquier momento, según la cotización bursátil o precio comercial, el plazo de maduración y la tasa nominal de interés, cuál es la rentabilidad efectiva de un papel comprado o vendido bajo estas condiciones. Así mismo, estas tablas indican cuál debe ser el precio de venta o compra de un papel para obtener una rentabilidad efectiva deseada, si se conocen sus condiciones respecto al plazo de vencimiento y su tasa nominal de interés.

A causa del proceso inflacionista por el que atraviesa la economía colombiana desde hace algunos años, las tasas nominales y efectivas de interés en Colombia han registrado un incremento considerable y, por tal motivo, las tablas calculadas para los países industriales no tienen, prácticamente, aplicación en nuestro medio, por llegar sus tipos de interés nominal y efectivos apenas hasta un 10 o 12% anual.

Ante la necesidad de llenar este vacío y tomando en cuenta que con los procesos de industrialización y monetización en la economía, los círculos financieros desean conocer más exactamente cuál es el rendimiento o costo real y efectivo de sus inversiones, la Asociación Colombiana de Actuarios ha querido contribuir efectivamente a dilucidar este aspecto, ofreciendo por primera vez en Colombia estas Tablas calculadas electrónicamente, según la más estricta técnica actuarial. El lector podrá apreciar la rica gama de tasas de interés y de plazos que ofrecen este Manual, así como la modalidad de sorteos periódicos para algunos papeles de renta fija, los cuales contribuyen a aumentar la rentabilidad de un título favorecido.
